

### Materials and technology

VISION possesses great research potential and carries out regular monitoring of the ecological state in different regions of the earth. In this way the most suitable places are chosen for cultivating the plants used in VISION'S products. The company has determined 75 of the most ecologically pure, natural regions, which fulfill VISION'S standards and which presently supply the material for biologically active food supplements and cosmetics. Our specialists also take other parameters into account like how rarefied the air is, the altitude where growing takes place, the average yearly temperature, humidity, the intensity of ultraviolet rays, or the orientation of the growing area in terms of the sides of the earth. All of the information collected is kept in a dynamic database, which is updated daily. This database makes up the Company's know-how and is its trade secret. On the basis of the data collected, ecological certifications of regions are made out. The story of the creation of every capsule and every biologically active supplement begins from the moment certifications are given to regions.

The plant ingredients are only collected at specific times of the year, because the time of harvest is a decisive factor in sustaining the vital strength of herbs. Next, the live herbs are put into special, "eco-containers" and delivered to the factory. VISION'S products are unique not only because of the purity of the plant materials used in their production but also because of the unique technology used to extract their active ingredients. The unique technology of cryogrinding, where the raw plant materials are frozen and ground in the presence of low temperatures (-196 C) in an atmosphere of neutral nitrogen gas, is used during the production of VISION'S biologically active food supplements. Extraction is done under high carbon dioxide compression (up to 300 bar).

## **Production technology**

---

This process allows for the retention of beneficial qualities from the plant ingredients, without destroying the vital strength of the herbs. Their extracts are obtained in a powder form which is uniquely natural, hypoallergenic and micro-biologically clean, without residual solvents or chemicals. VISION'S biologically active food supplements (BAFS) and cosmetics are produced in conditions that fully conform to GMP norms, which concern pharmaceutical preparations. In addition, all of the VISION'S supplements are subjected to many laboratory and clinical tests before they reach the end user. At the same time, the Company gives a one hundred percent safety guarantee to anyone who takes the supplements in the recommended amounts.
